Dear George,

For your 12 door Sides to an internal application for 30 minutes fire protection for a white application as follows equates to 24m2, that's 6 doors to both sides,

All coats to be applied on the same day and do not apply a coat until the coat before is dry, takes about 55 minutes to dry each coat. This application will allow the substrate to be lightly cleaned if necessary at a later date.

All the doors must have 3 hinges. Your doors fit the criteria for upgrading with Envirograf products.

1 coat of HWAP Primer at 12m2 per litre requires 2 litres priced at £50

2 coats of HW01 white intumescent at 8m2 per litre per coat requires 6 litres priced at £172.38

1 coat of HW04/s white top coat at 10m2 per litre requires 2.5 litres priced at £56.83 – **you then can decorate your eggshell black or white/BLUE over the top with the exception of Farrow and Ball and eco-friendly paints**. We would always recommend trying a test patch area first prior to a full application.

Should you require a certificate of supply , order this when you order the coatings are £15 with uk mainland carriage set at £18.50 and all prices are plus VAT.

Attached are our data sheets and fire test, it is your responsibility to ensure these meet with your compliance/requirements prior to placing an order.

This is supply of materials only, You would use these coats and then applicate your eggshell over the top. **I can see you have one side of a door non-painted but I have counted this as being painted to a white under coat, if that side of the door must remain clear please come back to me**.

Best Regards
